[Abstract submitted to 2nd Annual International Conference on Solid-State Lasers
for Application to Inertial Confinement Fusion (ICF), Paris, France (1996)]

Abstract

At the heart of the National Ignition Facility (NIF) is a Nd:Glass laser system. Design of this one micron laser must be based on the best available modeling and experimentation because it is the most expensive part of NIF. The components of the one micron laser portion of the NIF and the function they provide will be discussed.

*Work performed under the auspices of the U.S. Department of Energy by the Lawrence Livermore National Laboratory under contract number W-7405-ENG-48.
